

Computer Systems Analyst

Computer Systems Analyst will help the organization to utilize computer technology efficiently and effectively. The analyst works in close coordination with the IT department and will advise the management on system upgrades and new technologies. The professionals create new designs, assist new users, and configure hardware and software as and when necessary.

The Systems Analyst will evaluate the company's current computer systems and will suggest cost-effective changes to increase productivity. They develop code computer system updates and will work with software developers to implement the changes. The professionals monitor computer system performance, design and develop new computer systems and resolve any problems post-implementation.

The analyst will play an active role in designing and developing new computer applications and enhancements to existing apps. They use system models, diagrams and charts to offer direction to system developers and engineer. The professional will assist in the deployment and customization of new systems. They should have an in-depth understanding of how IT processes and components work.
